MOS FET Relay Modules

MOS FET Relay Module SPDT contact form type line up

The new value of MOS FET Relays now available

MOS FET Relay Modules are new products which bring SPDT contact structure, while still keeping long endurance and high reliability. These modules are suitable for many applications that use SPDT mechanical relays in place of reed relays, as they eliminate endurance concerns.

MOS FET Relay Module SPDT contact form type

NEW

G3VM-26M10 (Low C_{OFF})

Suitable for high-frequency switching ($\leq 300\text{MHz}$)

G3VM-26M11 (Low R_{ON})

Suitable for high-current switching ($\leq 1\text{A}$)

G3VM-66M (Diversified)

Can be used for various purposes due to 60V 0.4A rating

Feature 1 Easily achieve SPDT contact structure on your board

Complex wiring/components choices not needed

Whole complex circuit in module
SPDT module contributes to efficiency of board design.

Feature 2 Saves mounting area due to vertical structure

If making them on board ... 250 mm² *

Mounting Space ... 56 mm²

Compared with making them on board

78%* area saving

Contributes to space efficiency and better performance for your equipment.

* By our own research

Feature 3 Contributes to long life

Wear failure will no happen due to switching, because no physical contacts exist inside.

MOS FET Relay Module T switch function type line up

The world's first * very low leakage current MOS FET Relay modules by "T-structure inside".

These modules achieve very low leakage current which contribute high accuracy measurement of testing equipment for semiconductors and so on. It's the world's first* "T structure circuit installed" module with a combined 3 MOS FET relays.

*As of 2019, April.

MOS FET Relay Module T switch function type

NEW

G3VM-21MT (Low CxR)

Suitable for High frequency ($\leq 1.5\text{GHz}$) and low signal

* Developing other line up now

Feature 1 Achieves extremely low leakage current

Current leakage I_{LEAK} vs Applied voltage V_{DD}

Example of G3VM-21MT measuring circuit

Leakage current $\leq 1\text{pA}$

Actual performance is lower than 0.1pA for lowest suppressing effect for accuracy of measurement equipment.

This is suitable for as an alternative from Reed relays.

Feature 2 Contributes to mounting area saving due to a very small package

Very small outline

5 mm $\times$ 3.75 mm $\times$ 2.7 mm

Achieves very small size even though it's equipped with complex circuits. Contributes to high density mounting on the board.

Feature 3 Significant reduction for maintenance cycles

No physical contact;
prevents contact failure
from wear

Very long life

Output circuit is structured by MOS FET relay, which is a semiconductor with no physical contact. Therefore, there is no wear failure due to no switching of arc.

About MOS FET relays

OMRON's MOS FET Relays lead the industry in optical semiconductor technology, utilizing an input LED, Photodiode Dome Array (PDA) used as photocoupler and MOS FET chip in the load switching current.

In addition to being maintenance free, the MOS FET relay features high-speed operation and compact size, further promoting the replacement of mechanical relays.

Omron is expanding its wide range of products, from the industry's smallest class* new package (S-VSON/VSON) to our high current, high dielectric strength, and high sensitivity models.

*As of March, 2018.

Advantages of MOS FET relays

Ultra small size and weight

In addition to small size and weight the ultra-compact VSON and S-VSON packages, contributing to downsizing of equipment.

Low drive currents

Realizing energy saving with standard driving current of 2-15mA. Ultrasensitive models are also available featuring Drive Currents as low as 0.2mA (max).

Long operating life

MOS FET Relays use light signal instead of moveable contacts, avoiding reduction of life caused by contact wear, substantially increasing operational life.

Small leakage current

Can withstand external surge current without addition of snubber circuit. Under normal conditions, the typical leakage current is about 1 nA or below.

Excellent shock resistance

All the internal parts use casting method, and there are no movable parts in it, so it has excellent shock and vibration resistance.

High insulation

MOS FET relays offer great I/O isolation due to their operational principles. They turn the voltage into light and transfer by light signal, therefore input and output are isolated. The standard models offer 2,500 Vrms between input and output. Superior 5,000 VAC products are also available. 3,750 VAC products have also been added to the SOP package series.

Silent operation

As MOS FET Relays do not have mechanical contacts, by using a MOS FET instead of an electromechanical relay, it is possible to eliminate switching noise in your applications.

High-speed switching

Comparing with the switching time of 3 to 5 ms of a mechanical relay, its switching time is shortened to 0.2 ms(SSOP, USOP, VSON). It achieves quick response performance.

Control the micro analog signal correctly

Comparing with the triac, MOS FET greatly reduces the dead zone. The input waveform of micro analog signal does not suffer distortion as it does with a triac and is basically converted into output waveform without distortion.

Structure and operational principle of MOS FET relays

[Internal structure]

MOS FET relay consists of the following three components:

- ① LED (light emitting diode)
- ② Photodiode dome array (PDA)
- ③ MOS FET

[Operational Principle]

- (1) The LED lights up when the current is connected at the input side.
- (2) The light sent by the LED will be converted into voltage when it is received by the photodiode.
- (3) This voltage will be the gate voltage to drive the MOS FET via control circuit.

Features of OMRON's MOS FET Relays

Feature 1 Achieves high sensitivity (low driving current) with white mold resin package!

Many models of OMRON's MOS FET Relays are made with white mold resin in order to achieve high sensitivity.

Feature 2 High dielectric strength is achieved with the black package!

High Dielectric Strength types adopted a black package (black mold resin). And High Dielectric Strength was achieved by the double mold structure. Black package models have been added to the DIP and SOP series.
DIP: 5,000 VAC, SOP: 3,750 VAC

Feature 3 Good solderability with small package!

● VSON/S-VSON Package . . . Non-lead type

3 Selection Tips

Tip 1

Take note of voltage and current values

Load voltage and continuous load current values are the maximum values. Take particular note in the case of AC load.

$$\text{Effective value} \times \sqrt{2} = \text{maximum value}$$

Ex. Commercial power 100 VAC (effective value) → select from maximum value of 141 V or above

Tip 2

Load with inrush current

Guide for inrush current:
up to 3x the continuous load current (100 ms)
(Listed in the catalog as "Pulse ON current")

Tip 3

Double the current volume with connection C (DC load only)

Types compatible with connection C (parallel connection of two MOS FET elements) offer switching with double the continuous load current.
