## 1.2 Description

ESP32-S3-WROOM-1 and ESP32-S3-WROOM-1U are two powerful, generic Wi-Fi + Bluetooth LE MCU modules that are built around the ESP32-S3 series of SoCs. On top of a rich set of peripherals, the acceleration for neural network computing and signal processing workloads provided by the SoC make the modules an ideal choice for a wide variety of application scenarios related to AI and Artificial Intelligence of Things (AIoT), such as wake word detection, speech commands recognition, face detection and recognition, smart home, smart appliances, smart control panel, smart speaker, etc.

ESP32-S3-WROOM-1 comes with a PCB antenna. ESP32-S3-WROOM-1U comes with an external antenna connector. A wide selection of module variants are available for customers as shown in Table 1 and 2. Among the module variants, those embed ESP32-S3R8 operate at  $-40 \sim 65$  °C ambient temperature, ESP32-S3-WROOM-1-H4 and ESP32-S3-WROOM-1U-H4 operate at  $-40 \sim 105$  °C ambient temperature, and other module variants operate at  $-40 \sim 85$  °C ambient temperature. Please note that for R8 series modules (8-line PSRAM embedded), if the PSRAM ECC function is enabled, the maximum ambient temperature can be improved to 85 °C, while the usable size of PSRAM will be reduced by 1/16.

### 3.3 Strapping Pins

**Note:**

The content below is excerpted from [ESP32-S3 Series Datasheet](#) > Section *Strapping Pins*. For the strapping pin mapping between the chip and modules, please refer to Chapter 5 *Module Schematics*.

At each startup or reset, a module requires some initial configuration parameters, such as in which boot mode to load the module, voltage of flash memory, etc. These parameters are passed over via the strapping pins. After reset, the strapping pins operate as regular IO pins.

The parameters controlled by the given strapping pins at module reset are as follows:

- **Chip boot mode** – GPIO0 and GPIO46
- **VDD\_SPI voltage** – GPIO45
- **ROM messages printing** – GPIO46
- **JTAG signal source** – GPIO3

GPIO0, GPIO45, and GPIO46 are connected to the chip's internal weak pull-up/pull-down resistors at chip reset. These resistors determine the default bit values of the strapping pins. Also, these resistors determine the bit values if the strapping pins are connected to an external high-impedance circuit.

**Table 4: Default Configuration of Strapping Pins**

| Strapping Pin | Default Configuration | Bit Value |
|---------------|-----------------------|-----------|
| GPIO0         | Pull-up               | 1         |
| GPIO3         | Floating              | –         |
| GPIO45        | Pull-down             | 0         |
| GPIO46        | Pull-down             | 0         |

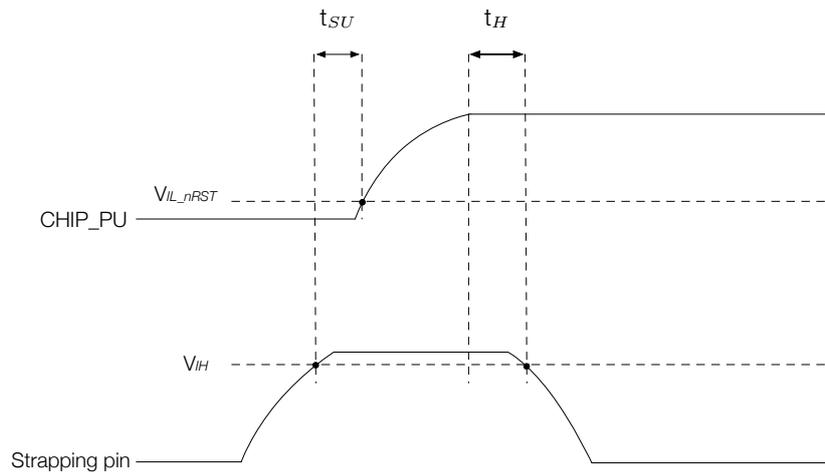

To change the bit values, the strapping pins should be connected to external pull-down/pull-up resistances. If the ESP32-S3 is used as a device by a host MCU, the strapping pin voltage levels can also be controlled by the host MCU.

All strapping pins have latches. At system reset, the latches sample the bit values of their respective strapping pins and store them until the chip is powered down or shut down. The states of latches cannot be changed in any other way. It makes the strapping pin values available during the entire chip operation, and the pins are freed up to be used as regular IO pins after reset.

Regarding the timing requirements for the strapping pins, there are such parameters as *setup time* and *hold time*. For more information, see Table 5 and Figure 4.

**Table 5: Description of Timing Parameters for the Strapping Pins**

| Parameter | Description   | Min (ms) |
|-----------|---|----------|
| $t_{SU}$  | <i>Setup time</i> is the time reserved for the power rails to stabilize before the CHIP_PU pin is pulled high to activate the chip.   | 0        |
| $t_H$     | <i>Hold time</i> is the time reserved for the chip to read the strapping pin values after CHIP_PU is already high and before these pins start operating as regular IO pins. | 3        |

**Figure 4: Visualization of Timing Parameters for the Strapping Pins**

### 3.3.1 Chip Boot Mode Control

GPIO0 and GPIO46 control the boot mode after the reset is released. See [Table 6 Chip Boot Mode Control](#).

**Table 6: Chip Boot Mode Control**

| Boot Mode                        | GPIO0       | GPIO46        |
|----------------------------------|-------------|---------------|
| Default Configuration            | 1 (Pull-up) | 0 (Pull-down) |
| <b>SPI Boot (default)</b>        | 1           | Any value     |
| <b>Download Boot</b>             | 0           | 0             |
| Invalid combination <sup>1</sup> | 0           | 1             |

<sup>1</sup> This combination triggers unexpected behavior and should be avoided.

### 3.3.2 VDD\_SPI Voltage Control

Depending on the value of EFUSE\_VDD\_SPI\_FORCE, the voltage can be controlled in two ways.

Table 7: VDD\_SPI Voltage Control

| EFUSE_VDD_SPI_FORCE | GPIO45  | eFuse <sup>1</sup> | Voltage | VDD_SPI power source <sup>2</sup> |

<sup>2</sup> See [ESP32-S3 Series Datasheet](#) > Section *Power Scheme*

### 3.3.3 ROM Messages Printing Control

During boot process the messages by the ROM code can be printed to:

- (Default) UART and USB Serial/JTAG controller.
- USB Serial/JTAG controller.
- UART.

The ROM messages printing to UART or USB Serial/JTAG controller can be respectively disabled by configuring registers and eFuse. For detailed information, please refer to [ESP32-S3 Technical Reference Manual](#) > Chapter *Chip Boot Control*.

### 3.3.4 JTAG Signal Source Control

The strapping pin GPIO3 can be used to control the source of JTAG signals during the early boot process. This pin does not have any internal pull resistors and the strapping value must be controlled by the external circuit that cannot be in a high impedance state.

As Table 8 shows, GPIO3 is used in combination with EFUSE\_DIS\_PAD\_JTAG, EFUSE\_DIS\_USB\_JTAG, and EFUSE\_STRAP\_JTAG\_SEL.

## 4.4 Current Consumption Characteristics

### 4.4.1 RF Current Consumption in Active Mode

<sup>1</sup> Current consumption when all peripheral clocks are **disabled**.

<sup>2</sup> Current consumption when all peripheral clocks are **enabled**. In practice, the current consumption might be different depending on which peripherals are enabled.

<sup>3</sup> In Modem-sleep mode, Wi-Fi is clock gated, and the current consumption might be higher when accessing flash. For a flash rated at 80 Mbit/s, in SPI 2-line mode the consumption is 10 mA.

**Table 14: Current Consumption in Low-Power Modes**

| Work mode                | Description   | Typ ( $\mu$ A) |
|--------------------------|---|----------------|
| Light-sleep <sup>1</sup> | VDD_SPI and Wi-Fi are powered down, and all GPIOs are high-impedance. | 240            |
| Deep-sleep               | RTC memory and RTC peripherals are powered up.                        | 8              |
|                          | RTC memory is powered up. RTC peripherals are powered down.           | 7              |

|           |   |   |
|-----------|---|---|
| Power off | CHIP_PU is set to low level. The chip is shut down. | 1 |
|-----------|---|---|

<sup>1</sup> In Light-sleep mode, all related SPI pins are pulled up. For chips embedded with PSRAM, please add corresponding PSRAM consumption values, e.g., 140  $\mu\text{A}$  for 8 MB 8-line PSRAM (3.3 V), 200  $\mu\text{A}$  for 8 MB 8-line PSRAM (1.8 V) and 40  $\mu\text{A}$  for 2 MB 4-line PSRAM (3.3 V).

## 7.2 Recommended PCB Land Pattern

This section provides the following resources for your reference:

- Figures for recommended PCB land patterns with all the dimensions needed for PCB design. See Figure 10 *ESP32-S3-WROOM-1 Recommended PCB Land Pattern* and Figure 11 *ESP32-S3-WROOM-1U Recommended PCB Land Pattern*.
- Source files of recommended PCB land patterns to measure dimensions not covered in Figure 10 and Figure 11. You can view the source files for [ESP32-S3-WROOM-1](#) and [ESP32-S3-WROOM-1U](#) with [Autodesk Viewer](#).
- 3D models of [ESP32-S3-WROOM-1](#). Please make sure that you download the 3D model file in .STEP format (beware that some browsers might add .txt).

### 7.3 Dimensions of External Antenna Connector

ESP32-S3-WROOM-1U uses the first generation external antenna connector as shown in Figure 12 *Dimensions of External Antenna Connector*. This connector is compatible with the following connectors:

- U.FL Series connector from Hirose
- MHF I connector from I-PEX
- AMC connector from Amphenol

## 8 Product Handling

### 8.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and 90%RH. The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and 60%RH. If the above conditions are not met, the module needs to be baked.

### 8.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 8.3 Soldering Profile

#### 8.3.1 Reflow Profile

Solder the module in a single reflow.

## 8.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
