NE556
SA556 - SE556

General-purpose dual bipolar timers

Features

- Low turn-off time
- Maximum operating frequency greater than 500 kHz
- Timing from microseconds to hours
- Operates in both astable and monostable modes
- Output can source or sink up to 200 mA
- Adjustable duty cycle
- TTL compatible
- Temperature stability of 0.005% per °C

Description

The NE556, SA556 and SE556 dual monolithic timing circuits are highly stable controllers capable of producing accurate time delays or oscillation. In the time delay mode of operation, the time is precisely controlled by one external resistor and capacitor. For a stable operation as an oscillator, the free running frequency and the duty cycle are both accurately controlled with two external resistors and one capacitor.

The circuits may be triggered and reset on falling waveforms, and the output structure can source or sink up to 200 mA.

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	18	V
I_{OUT}	Output current (sink and source)	±225	mA
R_{thja}	Thermal resistance junction to ambient(1) DIP14 SO-14	 80 105	°C/W
R_{thjc}	Thermal resistance junction to case (1) DIP14 SO-14	 33 31	°C/W
ESD	Human body model (HBM)(2)	1000	V
	Machine model (MM)(3)	150	
	Charged device model (CDM)(4)	1500	
	Latch-up immunity	200	mA
T_{LEAD}	Lead temperature (soldering 10 seconds)	260	°C
T_j	Junction temperature	150	°C
T_{stg}	Storage temperature range	-65 to 150	°C

1. Short-circuits can cause excessive heating. These values are typical and valid only for a single layer PCB.
2. Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
3. Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
4. Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

1. Tested at V_{CC} = +5 V and VCC = +15 V
2. This will determine the maximum value of R_A + R_B for +15V operation the max total is R = 20 MΩ and for +5 V operation the max total R = 3.5 MΩ
3. Specified with trigger input high
4. No protection against excessive pin 7 current is necessary, providing the package dissipation rating will not be exceeded
5. Time measured from a positive going input pulse from 0 to 0.8 x V_{CC} into the threshold to the drop from high to low of the output trigger is tied to threshold.

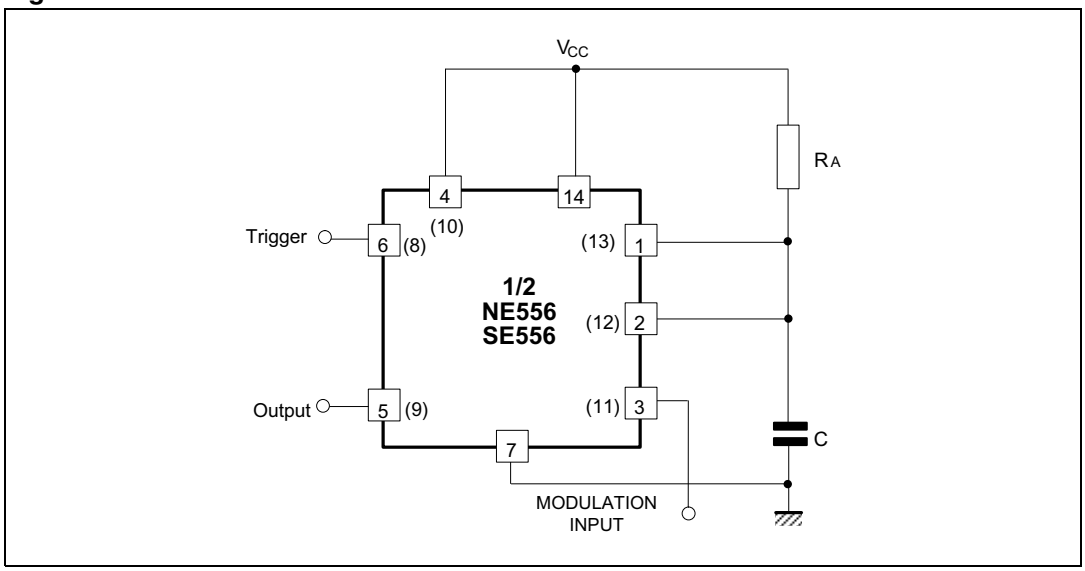

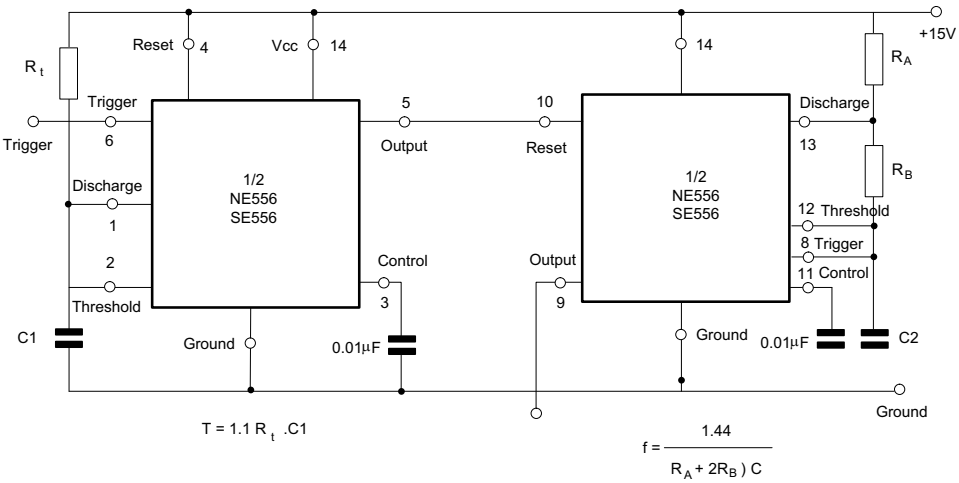

Figure 14. Tone burst generator

For a tone burst generator the first timer is used as a monostable and determines the tone duration when triggered by a positive pulse at pin 6. The second timer is enabled by the high output or the monostable. It is connected as an astable and determines the frequency of the tone.
