DATA SHEET FOR STANDARD SENSOR TYPE
CP149-150-151-152-153-154-174 (FROM 2011)

Sensor Description

Sensor Type	Pressure Sensitive Single Sensor
Typical applications	Infinite variable resistive user interface devices
Number of active areas / cells	1
Dimensions and available connectors	See layout drawings on annexe

Manufacturing Tolerances

Length and width tolerances	according DIN 7151 IT 14
Thickness	Nominal value (see drawings) +/- 12 %
Total manufacturing tolerance	+/- 0.8 mm

Base Materials

Topside substrate	PET film
Laminating adhesive	Acrylic
Backside substrate	PET film
Backing adhesive (upon request)	Acrylic

Operating Parameters

Standby resistance (no load)	$R_{NL} > 1 \text{ M}\Omega$
Typical activation resistance range for a pressure range of	$1 \text{ M}\Omega > R_L > 2 \text{ k}\Omega$ $0.5\text{-}100 \text{ N/cm}^2$ (i.e. per cm^2 of activated area)
Typical Conductor lead resistance	$\leq 25 \Omega$
Typical lifetime when used according to application advice (see page 2)	$> 1.000.000$ cycles @ 1 kg/cm^2 and 1Hz
Typical sensor response time on single activation	2-3 ms (mechanical)
Current density	$< 1 \text{ mA/cm}^2$ (of activated area)
Parasitic capacitance	$< 1 \text{ nF}$
Power dissipation	$< 1 \text{ mW/cm}^2$ (of activated area)

Operating Conditions

Nominal operating voltage	1..5 V Use pulsed voltage (duty cycle $< 2 \%$) for extended lifetime and heavy duty conditions
Operating temperature range	-40 to $+85 \text{ }^\circ\text{C}$ (-40 to $185 \text{ }^\circ\text{F}$)
Operating humidity range	$\leq 95 \%$ R.H.

This general specification sheet has been created on 15.03.11 and supersedes all previous versions.

Standard Test Criteria at Time of Delivery

Standby resistance	$R_{NL} > 1 \text{ M}\Omega$ @ RT and 5 V DC
Measuring device	IEE load applicator (see table 1 for load values)
Force probe surface material	Rubber pad
Thickness of pad	2 mm +/- 0.2 mm
Rubber hardness	65 Shore A (+/- 10 Shore A)
Endtest criteria:	

Sensor Type	Detection area dimension	Force probe diameter	Test weight load	Typical resistance at test load
Standard 149	circular, $\varnothing$ 6mm	4 mm	500 g	$30 \text{ k}\Omega > R_L > 3 \text{ k}\Omega$
Standard 150	$8.1 \times 7.5 \text{ mm}$	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$
Standard 151	circular, $\varnothing$ 12 mm	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$
Standard 152	circular, $\varnothing$ 16 mm	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$
Standard 153	$22.3 \times 21.6 \text{ mm}$	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$
Standard 154	$40.6 \times 40.3 \text{ mm}$	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$
Standard 174	circular, $\varnothing$ 25 mm	6 mm	1100 g	$15 \text{ k}\Omega > R_L > 5 \text{ k}\Omega$

Application Advice

- The sensor should be mounted onto an even, smooth, and hard support surface like, e.g., a plastic, glass or metal plate.
- The actuator should always be placed perpendicular to the sensor surface in the centre of the active area. Avoid offset mounting. Ensure that the actuator is smaller than the active area of the sensor. If this is not feasible, use a soft activator for force transmission and distribution like, e.g., a soft rubber with hardness ≤ 25 Shore A.
- Do not expose the sensor to permanent load to avoid possible signal drift.
- Never bend the sensor in the active area to avoid mechanical pre-load and false signals.
- Do not bend the connection tail to a radius $< 8 \text{ mm}$ to avoid broken conductor lines.
- All sensors feature an air vent. Take care not to block it and to avoid liquids from penetrating through it.

This general specification sheet has been created on 15.03.11 and supersedes all previous versions.

Example of response curve

[Response curve depending on actuator shape material and design
Measurements performed with a 4mm probe diameter covered with a 2mm thick rubber of 65 Shore A]

Simplified sensor equivalent circuit

Use an ohmmeter with PC interface option for dynamic data recording. An ordinary ohmmeter will be sufficient, if you do not intend to record data.

This general specification sheet has been created on 15.03.11 and supersedes all previous versions.

General Statement

The use of our proprietary pressure sensing technology is very flexible, thus allowing tailor-made design solutions on a relatively short time scale. Almost any shape or size can be designed. If this sensor type does not fulfil your demands, please feel free to contact your closest retailer concerning the availability of other sensor types for your application.

Liability Issues

IEE sensors are designed for multiple activations and will easily exceed the stated typical lifetime when used according to IEE instructions.

All values listed in datasheets are typical values. IEE cannot be held responsible for any deviation from these values unless a mutually agreed specification concerning a specific sensor design and performance has been signed.

The suitability of a chosen sensor for a specific application is not the concern of IEE, unless a complete sensor specification has been compiled by the customer and accepted by IEE. That specification must describe in detail every aspect of the desired application as well as the use of the sensor in said application.

Subsequent testing to prove the suitability of the sensor for a specific application does not supersede IEE specification sheets.

IEE refuses any responsibility for sensors used in applications of which IEE has no notice. The same is valid for applications of which IEE has been informed, if no written agreement stating specific features exists.

The customer is responsible for the validation of the IEE sensor in the end product.

Depending on the presence of backing adhesive or not and the connection method, CP sensors are available in different configurations
